## EOS // ALUMINIUM ALSI10MG

EOS Aluminum AlSi10Mg is an aluminum alloy in fine powder form which has been specially optimized for processing on EOSINT M systems

This document provides information and data for parts built using EOS Aluminum AlSi10Mg powder (EOS art.no. 9011-0024) on the following system specifications:

- EOSINT M 280 with PSW 3.6 and Original EOS Parameterset AlSi10Mg_Speed 1.0
- EOS M 290 400Watt with EOSPRINT 1.0 and Original EOS Parameterset AISi10Mg_Speed 1.0

## DESCRIPTION

AlSi1OMg is a typical casting alloy with good casting properties and is typically used for cast parts with thin walls and complex geometry. It offers good strength, hardness, and dynamic properties and is therefore also used for parts subject to high loads. Parts in EOS Aluminum AISi10Mg are ideal for applications which require a combination of good thermal properties and low weight. They can be machined, spark-eroded, welded, micro shotpeened, polished, and coated if required.

Conventionally cast components in this type of aluminum alloy are often heat-treated to improve the mechanical properties, e.g., using the T6 cycle of solution annealing, quenching, and age-hardening. The laser-sintering process is characterized by extremely rapid melting and re-solidification. This produces a metallurgy and corresponding mechanical properties in the as-built condition which is similar to T6 heattreated cast parts. Therefore, such hardening heat treatments are not recommended for laser-sintered parts, but rather a stress-relieving cycle of two hours at $300^{\circ} \mathrm{C}\left(572{ }^{\circ} \mathrm{F}\right)$. Due to the layerwise building method, the parts have a certain anisotropy, which can be reduced or removed by appropriate heat treatment - see Technical Data for examples.

## TECHNICAL DATA

GENERAL PROCESS AND GEOMETRICAL DATA

| Typical achievable part accuracy [1] [2] | $\pm 100 \mu \mathrm{~m}$ |  |
| :---: | :---: | :---: |
| Smallest wall thickness <br> [1] [3] | approx. $0.3-0.4 \mathrm{~mm}$ approx. $0.012-0.016$ inch |  |

|  | in vertical direction（ $\mathbf{Z}$ ） | $\begin{gathered} 70 \pm 10 \mathrm{GPa} \\ 10.2 \pm 0.7 \mathrm{Msi} \end{gathered}$ | $\begin{aligned} & 60 \pm 10 \mathrm{GPa} \\ & 8.7 \pm 0.7 \mathrm{Msi} \end{aligned}$ |
| Elongation at break ［6］ | in horizontal direction（XY） | $(9 \pm 2) \%$ | $12 \pm 2 \%$ |
|  | in vertical direction（ $Z$ ） | $(6 \pm 2) \%$ | $11 \pm 2 \%$ |
| Hardness［7］ |  | approx． $119 \pm 5$ HBW |  |
| Fatigue strength ［1］［8］ | in vertical direction（ $Z$ ） | approx． $97 \pm 7 \mathrm{MPa}$ approx． $14.1 \pm 1.0 \mathrm{ksi}$ |  |

［6］Mechanical strength tested as per ISO 6892－1：2009（B）annex D，proportional specimens，specimen diameter 5 mm ，original gauge length 25 mm （1 inch）． ［7］Hardness test in accordance with Brinell（HBW 2．5／62．5）as per DIN EN ISO 6506－1．Note that measured hardness can vary significantly depending on how the specimen has been prepared．
［8］Fatigue test with test frequency of $50 \mathrm{~Hz}, \mathrm{R}=-1$ ，measurement stopped on reaching 5 million cycles without fracture．
［9］Stress relieve：anneal for 2 h at $300^{\circ} \mathrm{C}\left(572{ }^{\circ} \mathrm{F}\right)$ ．
［10］These properties were determined on an EOSINT M 280－400W．Test parts from following machine type EOS M 290－400W correspond with these data．

## THERMAL PROPERTIES OF PARTS

|  | As-built [1] | Heat-treated [1] [9] |
| :---: | :---: | :---: |
| Thermal conductivity (at $\mathbf{2 0}^{\circ} \mathbf{C}$ ) <br> in horizontal direction (XY) | approx. $103 \pm 5 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ | approx. $173 \pm 10 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ |
| Thermal conductivity (at $\mathbf{2 0}{ }^{\circ} \mathbf{C}$ ) <br> in vertical direction (Z) | approx. $119 \pm 5 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ | approx. $173 \pm 10 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ |
| Specific heat capacity <br> in horizontal direction (XY) | approx. $920 \pm 50 \mathrm{~J} / \mathrm{kg}^{\circ} \mathrm{C}$ | approx. $890 \pm 50 \mathrm{~J} / \mathrm{kg}^{\circ} \mathrm{C}$ |
| Specific heat capacity <br> in vertical direction (Z) | approx. $910 \pm 50 \mathrm{~J} / \mathrm{kg}^{\circ} \mathrm{C}$ | approx. $890 \pm 50 \mathrm{~J} / \mathrm{kg}^{\circ} \mathrm{C}$ |

The data are valid for the combinations of powder material, machine and parameter sets referred to on page 1, when used in accordance with the relevant Operating Instructions (including Installation Requirements and Maintenance) and Parameter Sheet. Part properties are measured using defined test procedures. Further details of the test procedures used by EOS are available on request.

The data correspond to our knowledge and experience at the time of publication. They do not on their own provide a sufficient basis for designing parts. Neither do they provide any agreement or guarantee about the specific properties of a part or the suitability of a part for a specific application. The producer or the purchaser of a part is responsible for checking the properties and the suitability of a part for a particular application. This also applies regarding any rights of protection as well as laws and regulations. The data are subject to change without notice as part of EOS' continuous development and improvement processes.

## EOS // MARAGING STEEL MS1

EOS Maraging Steel MS1 is a steel powder which has been optimized especially for processing on EOSINT M systems.

This document provides information and data for parts built using EOS Maraging Steel MS1 powder (EOS art.-no. 9011-0016) on the following system specifications:

- EOSINT M 270 Installation Mode Standard with PSW 3.3 or 3.4 and default job MS1_020_default.job or MS1_040_default.job
- EOSINT M 270 Dual Mode with PSW 3.5 and EOS Original Parameter Set MS1_ Surface 1.0 or MS1_Performance 2.0
- EOSINT M 280 with PSW 3.5 and EOS Original Parameter Set MS1_Performance 1.0 or MS1_Speed 1.0

## DESCRIPTION

Parts built in EOS Maraging Steel MS1 have a chemical composition corresponding to US classification $18 \%$ Ni Maraging 300, European 1.2709 and German X3NiCoMoTi 18-9-5. This kind of steel is characterized by having very good mechanical properties, and being easily heat-treatable using a simple thermal agehardening process to obtain excellent hardness and strength.

Parts built from EOS MaragingSteel MS1 are easily machinable after the building process and can be easily post-hardened to more than 50 HRC by age-hardening at $490^{\circ} \mathrm{C}\left(914^{\circ} \mathrm{F}\right)$ for six hours. In both as-built and age-hardened states, the parts can be machined, sparkeroded, welded, micro shot-peened, polished, and coated if required. Due to the layerwise building method, the parts have a certain anisotropy, which can be reduced or removed by appropriate heat treatment - see Technical Data for examples.

[^0]
## EOS // EOS NICKEL ALLOY IN718

EOS Nickel Alloy IN718 is a heat- and corrosion- resistant nickel alloy powder which has been specially optimized for processing on EOS M systems.

This document provides information and data for parts built using EOS Nickel Alloy IN718 powder (EOS art.-no. 9011-0020) on the following system specifications:

- EOSINT M280 400W System with PSW3.6 and Parameter Set IN718_Performace 1.0
- EOS M290 400W System with EOSPRINT 1.0 and Parameter Set IN718_Performace 1.0

## DESCRIPTION

Parts built from EOS Nickel Alloy IN718 have chemical compositions corresponding to UNS N07718, AMS 5662, AMS 5664, W.Nr 2.4668, DIN NiCr19Fe19NbMo3. This kind of precipitation-hardening nickel-chromium alloy is characterized by having good tensile, fatigue, creep, and rupture strength at temperatures up to 700 ${ }^{\circ} \mathrm{C}\left(1290{ }^{\circ} \mathrm{F}\right)$.

This material is ideal for many high-temperature applications such as gas turbine parts, instrumentation parts, power, and process industry parts etc. It also has excellent potential for cryogenic applications.

Parts built from EOS Nickel Alloy IN718 can be easily post-hardened by precipitationhardening heat treatments. In both as-built and age-hardened states, the parts can be machined, spark-eroded, welded, micro shot-peened, polished and coated if required. Due to the layerwise building method, the parts have a certain anisotropy - see Technical Data for examples.

## TECHNICAL DATA

## GENERAL PROCESS DATA

| Typical achievable part accuracy [1], [11] | small parts | $\begin{gathered} \text { approx. } \pm 40-60 \mu \mathrm{~m} \\ \text { approx. } \pm 1.6-2.4 \times 10^{-3} \text { inch } \end{gathered}$ |
| :---: | :---: | :---: |
|  | large parts | $\pm 0.2$ \% |
| Min. wall thickness [2], [11] | typ. 0.3-0.4 mm typ. $0.012-0.016$ inch |  |
| Surface roughness [3], [11] | after shot-peening | Ra 4-6.5 $\mu \mathrm{m}$, Rz 20-50 $\mu \mathrm{m}$ Ra $0.16-0.25 \times 10-3$ inch, Rz 0.78-1.97 $\times 10-{ }^{-3}$ inch |
|  | after polishing | Rz up to $<0.5 \mu \mathrm{~m}$ <br> Rz up to $<0.02 \times 10-3$ inch (can be very finely polished) |
| Volume rate [4] | Parameter Set IN718 <br> Performance ( $40 \mu \mathrm{~m}$ ) | $\begin{gathered} 4 \mathrm{~mm}^{3} / \mathrm{s}\left(14.4 \mathrm{~cm}^{3} / \mathrm{h}\right) \\ 0.88 \mathrm{in}^{3} / \mathrm{h} \end{gathered}$ |

[1] Based on users' experience of dimensional accuracy for typical geometries, e.g. $\pm 40 \mu \mathrm{~m}$ ( $1.6 \times 10-3$ inch ) when parameters can be optimized for a certain class of parts or $\pm 60 \mu \mathrm{~m}$ ( $2.4 \times 10-3$ inch) when building a new kind of geometry for the first time. Part accuracy is subject to appropriate data preparation and postprocessing, in accordance with EOS training.
[2] Mechanical stability is dependent on geometry (wall height etc.) and application\#
[3] Due to the layerwise building, the surface structure depends strongly on the orientation of the surface, for example sloping and curved surfaces exhibit a stair-step effect. The values also depend on the measurement method used. The values quoted here given an indication of what can be expected for horizontal (up-facing) or vertical surfaces.
[4] Volume rate is a measure of build speed during laser exposure. The total build speed depends on the average volume rate, the recoating time (related to the number of layers), and other factors such as DMLS-Start settings.

[^1]
## EOS // STAINLESS STEEL GP1 FOR EOSINT M 270

A number of different materials are available for use with EOSINT M systems, offering a broad range of e-Manufacturing applications. EOS Stainless Steel GP1 is a stainless steel powder which has been optimized especially for EOSINT M 270 systems. Other materials are also available for EOSINT M systems, and further materials are continuously being developed - please refer to the relevant material data sheets for details.

This document provides a brief description of the principle applications and a table of technical data. For details of the system requirements please refer to the relevant information quote.

## DESCRIPTION, APPLICATION

EOS Stainless Steel GP1 is a pre-alloyed stainless steel in fine powder form. Its composition corresponds to US classification 17-4 and European 1.4542. This kind of steel is characterized by having good corrosion resistance and mechanical properties, especially excellent ductility in laser processed state, and is widely used in a variety of engineering applications.

This material is ideal for many part-building applications (DirectPart) such as functional metal prototypes, small series products, individualized products or spare parts. Standard processing parameters use full melting of the entire geometry with $20 \mu \mathrm{~m}$ layer thickness, but it is also possible to use Skin \& Core building style to increase the build speed. Using standard parameters, the mechanical properties are fairly uniform in all directions. Parts made from EOS Stainless Steel GP1 can be machined, spark-eroded, welded, micro shotpeened, polished and coated if required. Unexposed powder can be reused.

## Typical applications:

- Engineering applications including functional prototypes, small series products, individualized
- products or spare parts.
- Parts requiring high corrosion resistance, sterilizability, etc.
- Parts requiring particularly high toughness and ductility.

## TECHNICAL DATA

GENERAL PROCESS AND GEOMETRIC DATA

| Minimum recommended layer thickness | $\begin{aligned} & 20 \mu \mathrm{~m} \\ & 0.8 \mathrm{mil} \end{aligned}$ |  |
| :---: | :---: | :---: |
| Typical achievable part accuracy [1] | Small parts | $\begin{gathered} \pm 20-50 \mu \mathrm{~m} \\ 0.8-2.0 \mathrm{mil} \end{gathered}$ |
|  | Large Parts [2] | $\pm 0.2$ \% |
| Min. wall thickness [3] | $\begin{gathered} 0.3-0.4 \mathrm{~mm} \\ 0.012-0.016 \mathrm{in} \end{gathered}$ |  |
| Surface roughness | after shot-peening | Ra 2.5-4.5 $\mu \mathrm{m}$, Ry 15-40 $\mu \mathrm{m}$ Ra 0.1-0.2, Ry 0.6-1.6 mil |
|  | after polishing | $\begin{aligned} & \mathrm{Rz} \text { up to }<0.5 \mu \mathrm{~m} \\ & \text { (can be very finely polished) } \end{aligned}$ |
| Volume rate [4] | standard parameters ( 20 um layers, full density) |  |

[1] Based on users' experience of dimensional accuracy for typical geometries, e.g. $\pm 20 \mu \mathrm{~m}$ when parameters can be optimized for a certain class of parts or $\pm 50 \mu \mathrm{~m}$ when building a new kind of geometry for the first time.
[2] For larger parts, the accuracy can be improved by post-process stress-relieving at $650^{\circ} \mathrm{C}$ for one hour.
[3] Mechanical stability is dependent on geometry (wall height etc.) and application.
[4] Volume rate is a measure of build speed during laser exposure. The total build speed depends on the average = volume rate, the recoating time (related to the number of layers), and other factors such as DMLS-Start settings.

| Maximum operating temperature | $\begin{aligned} & 550^{\circ} \mathrm{C} \\ & 1022^{\circ} \mathrm{F} \end{aligned}$ |  |

The data are valid for the combinations of powder material, machine, and parameter sets referred to on page 1 when used in accordance with the relevant Operating Instructions (including Installation Requirements and Maintenance) and Parameter Sheet. Part properties are measured using defined test procedures. Further
details of the test procedures used by EOS are available on request.
The data correspond to our knowledge and experience at the time of publication. They do not on their own provide a sufficient basis for designing parts. Neither do they provide any agreement or guarantee about the specific properties of a part or the suitability of a part for a specific application. The producer or the purchaser of a part is responsible for checking the properties and the suitability of a part for a particular application. This also applies regarding any rights of protection as well as laws and regulations. The data are subject to change without notice as part of EOS' continuous development and improvement processes.

## EOS // TITANIUM TI64

EOS Titanium Ti64 is a titanium alloy powder which has been optimized especially for processing on EOSINT M systems.

This document provides information and data for parts built using EOS Titanium Ti64 powder (EOS art.-no. 9011-0014) on the following system specifications:

- EOSINT M 270 Installation Mode Xtended with PSW 3.4 and default job Ti64_30_030_default.job
- EOSINT M 270 Dual Mode with PSW 3.5 and Original EOS Parameter Set Ti64_Performance 2.0
- EOSINT M 280 with PSW 3.5 and Original EOS Parameter Set Ti64_Speed 1.0

## DESCRIPTION

Parts built in EOS Titanium Ti64 have a chemical composition corresponding to ISO 5832-3, ASTM F1472 and ASTM B348.

This well-known light alloy is characterized by having excellent mechanical properties and corrosion resistance combined with low specific weight and biocompatibility.

This material is ideal for many high-performance engineering applications, e.g., in aero-space and motor racing, and as well as the production of biomedical implants. (Note: subject to fulfilment of statutory validation requirements where appropriate.)

Due to the layerwise building method, the parts have a certain anisotropy, which can be reduced or removed by appropriate heat treatment - see Technical Data for examples.

## TECHNICAL DATA

GENERAL PROCESS AND GEOMETRIC DATA

| Typical achievable part accuracy [1] | $\pm 50 \mu \mathrm{~m}$ |  |
| :---: | :---: | :---: |
| Min. wall thickness [2] | approx. 99.85 \% | approx. $0.3-0.4 \mathrm{~mm}$ approx. $0.012-0.016$ inch |
| Surface roughness, asbuilt [3] | Ti64_30_030_default.job Ti64 Performance ( $30 \mu \mathrm{~m}$ ) | Ra 9-12 $\mu \mathrm{m}$, Rz $40-80 \mu \mathrm{~m}$ Ra $0.36-0.47 \times 10-3$ inch, Rz $1.6-3.2 \times 10-3$ inch |
|  | Ti64 Speed 1.0 (60 $\mu \mathrm{m}$ ) | Ra 6-10 $\mu \mathrm{m}, \operatorname{Rz} 35-40 \mu \mathrm{~m}$ Ra $0.23-0.39 \times 10-3$ inch, Rz $1.37-1.57 \times 10-3$ inch |

|  | Ti64 Speed $1.0(60 \mu \mathrm{~m})$ | $\begin{gathered} 9 \mathrm{~mm}^{3} / \mathrm{s}\left(32.4 \mathrm{~cm}^{3} / \mathrm{h}\right) \\ 1.98 \mathrm{in}^{3} / \mathrm{h} \end{gathered}$ |

[1] Based on users' experience of dimensional accuracy for typical geometries. Part accuracy is subject to appropriate data preparation and post-processing, in accordance with EOS training.
[2] Mechanical stability is dependent on geometry (wall height etc.) and application
[3] Due to the layerwise building, the surface structure depends strongly on the orientation of the surface. For example sloping and curved surfaces exhibit a stair-step effect. The values also depend on the measurement method used. The values quoted here given an indication of what can be expected for horizontal (up-facing) or vertical surfaces.
[4] Volume rate is a measure of build speed during laser exposure. The total build speed depends on the average volume rate, the recoating time (related to the number of layers) and other factors such as DMLS-Start settings.

## EOS // STAINLESS STEEL 316L

EOS Stainless Steel 316L is a corrosion-resistant iron based alloy which has been specially optimized for processing on EOSINT M280 systems.

This document provides information and data for parts built using EOS Stainless Steel 316L powder (EOS art.no. 9011-0032) on the following system specifications:

- EOSINT M280 400W System with PSW3.6 and Parameter Set 316L_Surface 1.0
- EOSINT M280 200W System with PSW3.6 and Parameter Set 316L_Surface 1.0

## DESCRIPTION

The parts built from EOS Stainless Steel 316L have chemical compositions corresponding to ASTM F138 "Standard Specification for Wrought 18Cr-14Ni-2.5Mo Stainless Steel Bar and Wire for Surgical Implants (UNS S31673)". This kind of stainless steel is characterized having a good corrosion resistance and evidence that there are no leachable substances in cytotoxic concentrations.

This material is ideal in:

- Lifestyle/Consumer - watches, other jewerry, glasses frames, decorations, functional elements in electronic housing, and accessories
- Automotive/Industrial - non-corroding common material, food, and chemical plants
- Aerospace/Turbine industry - entry-level material for Laser Sintering Technology, mounting parts, brackets, heat exchangers

Parts built from EOS Stainless Steel 316L can be machined, shot-peened and polished in as-built or stressrelieved (AMS2759) states if required. Solution annealing is not necessary because the mechanical properties of as-built state are showing desired values (ASTM A403). Parts are not ideal in temperature range $427^{\circ} \mathrm{C}-816^{\circ} \mathrm{C}$ where precipitation of chromium carbides occurs. Due to layerwise building method, the parts have a certain anisotropy which could be seen from mechanical properties.

## TECHNICAL DATA

## GENERAL PROCESS DATA

| Typical achievable part accuracy [1] | small parts | $\begin{gathered} \text { approx. } \pm 20-50 \mu \mathrm{~m} \\ ( \pm 0.0008-0.002 \text { inch }) \end{gathered}$ |

[1] Based on users' experience of dimensional accuracy for typical geometries, e.g. $\pm 40 \mu \mathrm{~m}$ when parameters can be optimized for a certain class of parts or $\pm 60 \mu \mathrm{~m}$ when building a new kind of geometry for the first time. Part accuracy is subject to appropriate data preparation and post-processing.
[2] Mechanical stability is dependent on geometry (wall height etc.) and application.
[3] Due to the layerwise building, the surface structure depends strongly on the orientation of the surface. For example, sloping and curved surfaces exhibit a stair-step effect. The values also depend on the measurement method used. The values quoted here given an indication of what can be expected for vertical surfaces
[4] Volume rate is a measure of build speed during laser exposure. The total build speed depends on the average volume rate, the recoating time (related to the number of layers), and other factors such as contour and Up/Down Skin parameters.

## PHYSICAL AND CHEMICAL PROPERTIES OF PARTS

| Material composition | Element | Min. | Max. |
| :---: | :---: | :---: | :---: |
|  | Fe | Balance |  |
|  | Cr | 17.00 | 19.00 |
|  | Ni | 13.00 | 15.00 |
|  | Mo | 2.25 | 3.00 |
|  | C |  | 0.030 |
|  | Mn |  | 2.00 |
|  | Cu |  | 0.50 |

The data are valid for the combinations of powder material, machine, and parameter sets referred to on page 1 when used in accordance with the relevant Operating Instructions (including Installation Requirements and Maintenance) and Parameter Sheet. Part properties are measured using defined test procedures. Further details of the test procedures used by EOS are available on request.

The data correspond to our knowledge and experience at the time of publication. They do not on their own provide a sufficient basis for designing parts. Neither do they provide any agreement or guarantee about the specific properties of a part or the suitability of a part for a specific application. The producer or the purchaser of a part is responsible for checking the properties and the suitability of a part for a particular application. This also applies regarding any rights of protection as well as laws and regulations. The data are subject to change without notice as part of EOS' continuous development and improvement processes.

## EOS // STAINLESS STEEL PH1 FOR EOSINT M 270

Several different materials are available for use with EOSINT M systems, offering a broad range of e-Manufacturing applications. EOS Stainless Steel PH1 is a stainless steel powder which has been specially optimized for EOSINT M 270 systems. Other materials are also available for EOSINT M systems, and further materials are continuously being developed - please refer to the relevant material data sheets for details.

This document provides a brief description of the principle applications and a table of technical data. For details of the system requirements, please refer to the relevant information quote.

## DESCRIPTION

EOS Stainless Steel PH1 is a pre-alloyed stainless steel in fine powder form. The chemistry of EOS Stainless Steel PH1 conforms to the compositions of DIN 1.4540 and UNS S15500.

This kind of steel is characterized by having good corrosion resistance and excellent mechanical properties, especially in the precipitation hardened state. This type of steel is widely used in va-riety of medical, aerospace, and other engineering applications requiring high hardness, strength, and corrosion resistance.

This material is ideal for many part-building applications (DirectPart) such as functional metal prototypes, small series products, individualized products or spare parts. Standard processing parameters use full melting of the entire geometry with $20 \mu \mathrm{~m}$ layer thickness, but it is also possible to use $40 \mu \mathrm{~m}$ layer thickness to increase the build speed. Using standard parameters the mechanical properties are fairly uniform in all directions. Parts made from EOS Stainless Steel PH1 can be machined, spark-eroded, welded, micro shotpeened, polished, and coated if required. Unexposed powder can be reused.

Typical applications:

- Engineering applications including functional prototypes, small series products, individualizedproducts or spare parts.
- Parts requiring high corrosion resistance, sterilisability, etc.
- Parts requiring particularly high hardness and strength.

## TECHNICAL DATA

## GENERAL PROCESS DATA

| Typical achievable part accuracy [1] | small parts | $\begin{gathered} \pm 20-50 \mu \mathrm{~m} \\ 0.8-2.0 \mathrm{mil} \end{gathered}$ |
| :---: | :---: | :---: |
|  | large parts | $\pm 0.2$ \% |
| Min. wall thickness [2] | approx. $0.3-0.4 \mathrm{~mm}$ <br> (0.012-0.016 inch) |  |
| Minimum recommended layer thickness | $\begin{aligned} & 20 \mu \mathrm{~m} \\ & 0.8 \mathrm{mil} \end{aligned}$ |  |
| Surface roughness [3] | after shot-peening | Ra $5 \pm 2 \mu \mathrm{~m} ; \mathrm{Rz} 30 \pm 10 \mu \mathrm{~m}$ Ra $0.2 \pm 0.08 \times 10-3$ inch; Rz $1.2 \pm 0.4 \times 10^{-3}$ inch |
|  | after polishing | Rz up to $<1 \mu \mathrm{~m}$ <br> Rz up to $<0.04 \times 10-3$ inch (can be very finely polished) |
| Volume rate [4] | standard parameters ( $20 \mu \mathrm{~m}$ layers, full density) | $\begin{aligned} & 1.8 \mathrm{~mm}^{3} / \mathrm{s} \\ & 0.40 \mathrm{in}^{3} / \mathrm{h} \end{aligned}$ |
|  | $40 \mu \mathrm{~m}$ layer parameters (full density) | $\begin{aligned} & 3.2 \mathrm{~mm}^{3} / \mathrm{s} \\ & 0.70 \mathrm{in}^{3} / \mathrm{h} \end{aligned}$ |

[1] Based on users' experience of dimensional accuracy for typical geometries, e.g. $\pm 20 \mu \mathrm{~m}$ when parameters can be optimized for a certain class of parts or $\pm 50 \mu \mathrm{~m}$ when building a new kind of geometry for the first time.
[2] Mechanical stability is dependent on geometry (wall height etc.) and application
[3] Volume rate is a measure of build speed during laser exposure. The total build speed depends on the average volume rate, the recoating time (related to the number of layers) and other factors such as DMLS-Start settings.

## PHYSICAL AND CHEMICAL PROPERTIES OF PARTS

| Material composition | Fe (balance) <br> Cr (14-15.5 wt-\%) <br> Ni (3.5-5.5 wt-\%) <br> $\mathrm{Cu}(2.5-4.5 \mathrm{wt}-\%)$ <br> Mn (max. 1 wt-\%) <br> Si (max. 1 wt-\%) <br> Mo (max. 0.5 wt-\%) <br> Nb (0.15-0.45 wt-\%) <br> C (max. 0.07 wt-\%) |
| :---: | :---: |
| Relative density with standard parameters | approx. 100 \% |
| Density with standard parameters | $\begin{aligned} & 7.8 \mathrm{~g} / \mathrm{cm}^{3} \\ & 0.28 \mathrm{lb} / \mathrm{in}^{3} \end{aligned}$ |

## MECHANICAL PROPERTIES OF PARTS [4]

|  |  | As-manufactured | Hardened [6] (mod H900 heat treatment) |
| :---: | :---: | :---: | :---: |
| Ultimate tensile strength [5] | in horizontal direction (XY) | $1150 \pm 50 \mathrm{MPa}$ | $\begin{gathered} \min 1310 \mathrm{MPa} \\ \text { (typical } 1450 \pm 100 \mathrm{MPa} \text { ) } \end{gathered}$ |
|  | in vertical direction ( $\mathbf{Z}$ ) | $1050 \pm 50 \mathrm{MPa}$ | $\begin{gathered} \min 1310 \mathrm{MPa} \\ \text { (typical } 1450 \pm 100 \mathrm{MPa} \text { ) } \end{gathered}$ |
| Yield strength, Rp0.2\% [5] | in horizontal direction (XY) | $1050 \pm 50 \mathrm{MPa}$ | $\begin{gathered} \min 1170 \mathrm{MPa} \\ \text { (typical } 1300 \pm 100 \mathrm{MPa} \text { ) } \end{gathered}$ |
|  | in vertical direction ( $\mathbf{Z}$ ) | $1050 \pm 50 \mathrm{MPa}$ | $\begin{gathered} \min 1170 \mathrm{MPa} \\ \text { (typical } 1300 \pm 100 \mathrm{MPa} \text { ) } \end{gathered}$ |
| Elongation at break [5] | in horizontal direction (XY) | $16 \% \pm 4$ \% | $\begin{gathered} \min 10 \% \\ \text { (typical } 12 \% \pm 2 \% \text { ) } \end{gathered}$ |
|  | in vertical direction (Z) | $17 \% \pm 4$ \% | $\begin{gathered} \min 10 \% \\ \text { (typical } 12 \% \pm 2 \% \text { ) } \end{gathered}$ |
| Hardness [5] |  | 30-35 HRC | $\min 40$ HRC |

[4] Mechanical testing according to ISO 6892:1998(E) Annex C, proportional test pieces, Diameter of the neck area 5 mm , original gauge length 25 mm , test pieces built in $20 \mu \mathrm{~m}$ layer-thickness
[5] Rockwell C (HRC) hardness measurement according to DIN EN ISO 6508-1. Note that depending on the measurement method used, the measured hardness value can be dependent on the surface roughness and can be lower than the real hardness. To avoid inaccurate results, hardness should be measured on a polished surface.
[6] Mechanical properties are expressed as minimum values to indicate that mechanical properties exceed the min. requirements of material specification standards such as ASTM A564-04 (XM12), ASTM A693-06 (XM12). Hardening of EOS Stainless Steel PH1 done using modified H900 heat treatment (soaking time at precipitation hardening temperature $482^{\circ} \mathrm{C}$ elongated from one hour to four hours).

THERMAL PROPERTIES OF PARTS (ROOM TEMPERATURE)

| Hardened [6] <br> (mod H900 heat <br> treatment) |  |  |  |
| :---: | :---: | :---: | :---: |
| Thermal conductivity | in horizontal direction (XY) | $13.8 \pm 0.8 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ | $15.7 \pm 0.8 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$$\quad$ in vertical direction (Z) |
|  | $13.7 \pm 0.8 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ | $15.8 \pm 0.8 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ |  |
